ABSTRACT

The door for an automated machine comprises a chassis delimiting an opening and equipped with guide means for the movement of at least one mobile panel, between a closed position in which the façade of the mobile panel at least partly closes the opening and an open position in which the mobile panel is located laterally with respect to the opening. According to the invention, the mobile panel comprises a reception structure for a man-machine interface for which the façade is accessible when the mobile panel is in the closed position, and a reception structure displacement means assuring that when the mobile panel is in the open position, the façade of the man-machine interface is moved towards the opening so that an operator in position in front of the opening can access the opening and the man-machine interface at the same time.
